MELANOMA RISK CALCULATOR

Clinical Decision Support Demonstration

We are pleased to introduce the first on-line risk predictor tool for cancer in New Zealand. This new tool for melanoma is part of our National *bestpractice* Decision Support Suit in collaboration with the Health Promotion Agency and Dr Mary-Jane Sneyd, University of Otago.

Risk of developing melanoma:

- The tool has been designed for use in asymptomatic New Zealanders
- Aged 20 years and older
- With fair, medium or olive skin
- No current or past history of melanoma

Key Features:

- The tool is very simple to use and will take less than five minutes.
- Answer some simple questions and the tool will calculate if your patient is at low, moderate, high or very high risk of developing melanoma in the next five years¹
- The risk calculator is not a diagnostic tool.

Melanoma Risk Assessment

The Melanoma Risk Predictor Tool was developed for New Zealanders aged over 20 years, of European ancestry. It should not be applied to people with coloured or dark skin. All fields are mandatory for the assessment to complete.

Demographics

NHI: R0K7074

Date of Birth: 20/02/1966 Age: 51

Sex: Male (selected) Female

Region of residence: North (selected) Midland Central South

Country of birth: NZ (selected) Not NZ

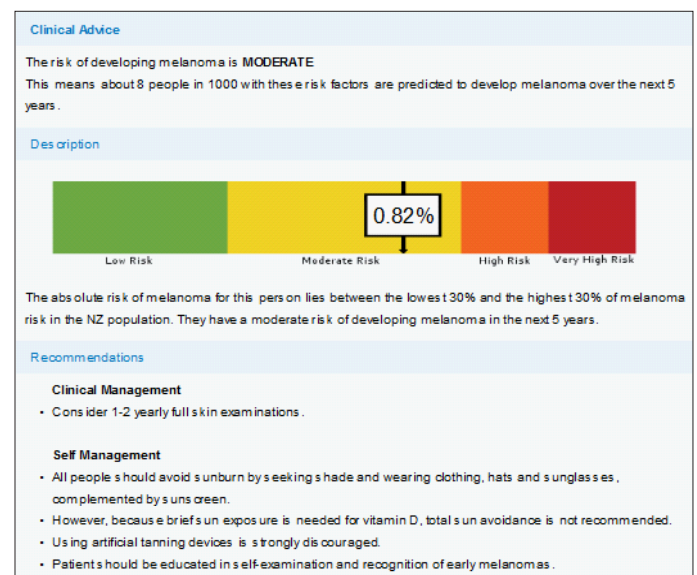

Other Questions
